

# Example Large Multi-page Table

Produced by: Ben Staton

This example is adapted from Table 5 in Staton (2018) – a report documenting in-season harvest and effort estimates and associated methodology. That report was prepared with ‘bookdown’ using a custom template.

**TABLE 1.** Salmon harvest from drift nets from all five openers by species and geographic stratum<sup>1</sup>. Numbers within parentheses are 95% confidence limits<sup>a,b</sup>.

**Note**

All estimates rounded to the nearest 10 fish.

Totals were rounded to the nearest 10 fish after calculating the sum of non-rounded estimates. As a result, the total presented in this table may differ by approximately 10 – 20 fish from the total obtained by summing the rounded estimates.

**Geographic Strata**

<sup>1</sup> A = Below Johnson River, B = Johnson River to Napaskiak, C = Napaskiak to Akiachak, D = Akiachak to Akiak

**Confidence Limits**

<sup>a</sup> Total means and 95% confidence limits within an opener were obtained via non-parametric bootstrap.

<sup>b</sup> Total means and 95% confidence limits across openers are the sum of opener-specific estimates.
